CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII.

JANUARY, 1927.

No. 1

GENERAL SUMMARY.

This was nearly a normal January, there being a slight deficiency in both temperature and precipitation. The snowfall was considerably less than usual at most places, and generally melted rapidly so that the fields were bare of snow covering the greater portion of the month. Cold periods centered about the 16th and 27th respectively, with a warm interval between those dates when the snow covering melted away and most of the frost was thawed out of the top soil. During that time there were numerous unfavorable reports regarding the probable effects on winter wheat, but at the end of the month our observers were mostly agreed that the damage was unimportant. There were practically no field operations reported during the month. Corn husking and hauling of the fodder preceded in a small way. The event of chief importance during the month was the high waters in the streams of the Ohio watershed, from the 20th to the 24th inclusive. The Allegheny river rose above the flood stage from Parkers Landing southward, and the Monongahela from Lock No. 4 northward. The Youghiogheny, Kishkimitas, and Beaver rivers became bank full, but no flood stages were reported. The Ohio river at Pittsburgh rose 4.7 feet above the flood stage. At Wheeling the river rose to a stage of 41.7 feet, the flood stage being 36.0 feet. The rise in the streams was comparatively slow and the stages were accurately forecast. Ample time elapsed for spreading the warnings and in consequence the damage was not heavy, being estimated at \$10,000 for the entire Pittsburgh river district. There were no severe or damaging storms during the month.

TEMPERATURE.

The mean temperature for the State, as deduced from the reports of 83 stations, was 27.4°, or 0.4° less than the January normal. The highest mean was 32.6° at Philadelphia Weather Bureau and Philadelphia-Germantown, and the lowest was 19.9°, at West Bingham. The highest temperature recorded during the month was 61°, at Uniontown on the 21st, and also at Hyndman on the 30th, while the lowest was 24° below zero, at West Bingham on the 27th. The greatest daily range of temperature was 52°, at West Bingham on the 27th.

PRECIPITATION.

The average precipitation, from rain and melted snow, for the State, as determined from the reports of 134 stations was 2.90 inches: a deficiency of 0.43 inch as compared with the normal for the month. The greatest amount recorded at any station was 8.28 inches, at Derry, and the least, 0.76 inch, was reported from Lawrenceville. The greatest amount recorded in any 24 consecutive hours was 3.73 inches at Derry on the 22d. The average snowfall for the State was 5.7 inches, or slightly more than half the January normal, 11.0 inches. The greatest monthly snowfall was 19.5 inches, at Corry, while the greatest 24-hour fall reported was 10.0 inches, at Paupack, on the 15th.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

FEBRUARY, 1927.

No. 2

GENERAL SUMMARY.

This was an unusually mild winter month, there being only three or four days with a mean temperature below the normal. There have been a few occasions when the mean temperature for the month was higher than it was this year, but in each instance the temperature range was greater. In other words, the minimum temperature for the month was higher in nearly all parts of the State than for any previous February. The snowfall was comparatively light until near the end of the third week when the heaviest snow and sleet storm of the winter occurred. In the greater portion of the State the highways were blocked for three or four days, while rail transportation was seriously delayed. Glaze occurred in some parts of the State, especially in the southeastern counties, accompanied by gales that broke thousands of telegraph, telephone, and electric light wires, leaving several of the smaller town in darkness. The storm also did some damage to trees and outbuildings. It brought the average snowfall for the State up to 6.1 inches above the February normal. When the snow melted rapidly a few days later it raised the streams from low to moderate or high stages, and some streams in the western part of the State were bank full. Flood stages were neared in the Monongahela, and in the upper Ohio river at Pittsburgh. The month was not wholly favorable for the winter grains, but the chief damage seems to have occurred to late seedings that did not become deeply rooted last autumn. The wheat crop as a whole was reported as fair to good at the end of the month.

TEMPERATURE.

The mean temperature for the State, as shown by the reports from 82 stations, was 35.0°, which is 7.3° above the February normal. The highest mean was 40.6° at Philadelphia Weather Bureau and the lowest was 27.4°, at West Bingham. The highest temperature recorded during the month was 69°, at Claysville, on the 16th, while the lowest, 8° below zero, occurred at Saegerstown on the 22d. The greatest daily range of temperature was 50°, at Saegerstown on the 22d.

PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as determined from the reports of 131 stations, was 3.48 inches, or an excess of 0.82 inch as compared with the normal for the month. The greatest monthly amount was 5.94 inches, at Johnstown, and the least was 1.25 inches at Montrose. The greatest amount recorded in any 24 consecutive hours was 2.25 inches, at Center Hall on the 21st. The average snowfall for the State was 16.5 inches, which is 6.1 inches greater than the February normal. The greatest monthly snowfall was 37.0 inches, at Carlisle, while the greatest 24-hour snowfall reported was 17.0 inches, at Johnstown and also at Unity Reservoir on the 19-20th.

THE HISTORY OF THE
CITY OF BOSTON
FROM THE FIRST SETTLEMENT
TO THE PRESENT TIME
BY NATHANIEL BENTLEY
VOLUME I
PUBLISHED BY J. B. BENTLEY
1822

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII.

MARCH, 1927.

No. 3

GENERAL SUMMARY.

The month, as a whole, was warm and dry, the temperature averaging 4.5° above normal for the State. Most of the excessive heat accumulated from the 5th to the 21st inclusive, the last decade being generally seasonable. During the warm period many kinds of vegetation started to grow, especially in the southeastern counties. Lawns became green and fruit buds started to swell. A return to seasonable temperatures came just in time to check such action and thus to save the fruit crop. The deficiency in precipitation was confined to the eastern half, and to the southern tier of counties in the western half of the State. Elsewhere there was a light to moderate excess. In the southeastern counties the deficiency averaged more than two inches. In other words there was a little more than a third of the normal amount. The snowfall for the month was very light, and was confined chiefly to a few central counties and to the plateau regions in the northeastern part of the State. There was practically no snow in the southeastern counties, and very little in the Ohio watershed. The streams in the Susquehanna and Ohio systems rose sharply at the end of the third week, and neared the flood stages at several stations on the 22d and 23d, but no damage was reported. The month was comparatively free from high winds and blustery weather that are typical of the average March. Wheat and grasses seemed to have wintered well in most sections. Early sown wheat was good without exception, but some of the late sown fields did not become well rooted before winter set in, and were more or less spotted. Pastures rated higher at the close of March in all parts of the State than they did a year ago.

TEMPERATURE.

The mean temperature for the State, as determined from the means of 80 stations, was 42.0°, which is 4.5° greater than the March normal. The highest mean was 46.5° at Philadelphia-Germantown, and the lowest was 34.6°, at Gouldsboro. The highest temperature recorded during the month was 82°, at Hyndman, on the 17th, while the lowest, six degrees below zero, occurred at West Bingham on the 2d. The greatest daily range of temperature was 51° at Catawissa on the 17th.

PRECIPITATION.

The average precipitation, from rain and melted snow, for the State, as deduced from the records of 135 stations, was 2.61 inches, which is a deficiency of 0.93 inch as compared with the State normal for March. The greatest monthly total was 5.43 inches, at Creekside, and the lowest 0.69 inch, at Doylestown. The greatest amount recorded in any 24 consecutive hours was 1.75 inches, on the 21st, at Sharon. Snowfall was light, averaging but 0.7 inch for the entire State. The normal March snowfall is 7.0 inches. The greatest monthly snowfall was 6.5 inches, at Mount Pocono, while the greatest 24-hour fall was 4.5 inches at Cresson, on the 26th.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII. APRIL, 1927. No. 4

GENERAL SUMMARY.

The temperature averaged near the normal in the Ohio basin, while there was a moderate deficiency at most places in the central and eastern portions of the State. The precipitation was nearly normal with about the usual April snowfall. In the northern tier of counties and on the higher plateau regions the snowfall was generally in excess of 2.0 inches, with 6.0 inches reported from Altoona and 8.0 inches from Coudersport. Most of the snow fell on the 2d or the 4th, and did not remain long on the ground. Vegetation was slow in starting, especially in the southeastern counties where a good early growth is usually made in April. However the moderate temperature deficiency that persisted during the first ten days was probably beneficial rather than otherwise as it delayed the blooming of orchard fruits. Severe frosts near the end of the month did considerable damage, especially on poorly drained lands. The weather conditions were favorable for wheat and it improved steadily throughout the entire month. Many fields that appeared to be very spotted at first were fairly well covered at the end of the month. Oats seeding was well advanced in the southern counties at the close of the month, and the first sown fields were coming up nicely, while seeding was getting well under way in the central counties. Wet soil delayed the planting of early field potatoes, and many of the truck crops, but early garden potatoes were coming up at the close of the month. Pastures and meadows were generally a little backward, but were otherwise good except clover that was spotted in some sections. Alfalfa seemed to be good in all parts of the State. Corn ground was being prepared for planting in the southern counties.

TEMPERATURE.

The mean temperature for the State, as determined from the means of 80 stations, was 47.7°, or a deficiency of 1.1° as compared with the April normal. The highest mean was 52.0°, at Newell, and the lowest was 41.2°, at Gouldsboro. The highest temperature recorded during the month was 92°, at Vandergrift, on the 19th, while the lowest for the month, 17°, was recorded at Brookville on the 11th. The greatest daily range was 53° at Huntingdon on the 12th.

PRECIPITATION.

The average precipitation, from rain and melted snow, as shown by reports from 134 stations, was 3.52 inches, or 0.15 inch more than the State normal for April. The greatest monthly total was 5.59 inches at Gettysburg, and the least was 1.65 inches, at Wilkes-Barre. The greatest amount recorded in any 24 consecutive hours was 2.65 inches, at Bustleton, on the 21st-22d. Snowfall for the State averaged 1.0 inch, which was 1.8 inches less than the normal amount for the month. The greatest monthly snowfall was 8.0 inches, at Coudersport, at which station 5.5 inches fell on the 2d.

VOL. XXXII.

MAY, 1927.

No. 5

GENERAL SUMMARY.

There was much cloudy, dark, and gloomy weather during the month, the sunshine averaging only 43 per cent of possible. Light rains were frequent, and while the average rainfall for the State was only slightly above the May normal yet there was an average of sixteen days with 0.01 inch or more. The frequent rains delayed all kinds of out door work and especially seedling and planting of crops. A moderate deficiency in temperature kept the soil too cold for a good and uniform germination of seeds, and the growth of most crops was slow. Frosts did considerable damage to tender crops, especially on the 28th. Orchard fruits were badly damaged in some sections. Considerable corn rotted in the ground so that it came up unevenly and much replanting was necessary. The corn that came up was yellowish in color and grew very slowly, and the crop was decidedly backward at the close of the month. The weather was more favorable for wheat and it made a good growth and development until near the end of the month when many reports of of damage by fly were received. Pastures and meadows were mostly in good condition, but were a little slow in growth. Farmers began cutting the first crop of alfalfa at the end of the month, and it was generally reported as satisfactory. Oats did well and was good to excellent at the close of the month with some reporters saying that it promised the best crop for several years. Early field potatoes came up unevenly during the first half, but improved considerably during the last half of the month. Truck crops were generally backward, but otherwise in good condition. A heavy hailstorm occurred in the southern portion of Franklin County on the 24th, covering a path about two miles wide and doing considerable damage. Heavy local rains flooded the small streams in Cumberland County on the 25th and 26th.

TEMPERATURE.

The mean temperature for the State, as deduced from reports from 84 stations, was 58.2°, which is 1.3° below the May normal. The highest monthly mean was 62.2° at Newell, and the lowest was 51.0°, at West Bingham. The highest temperature recorded during the month was 92°, at three stations: Hyndman on the 9th, and at Clearfield and Johnstown on the 22d. The greatest daily range of temperature was 50°, at Brookville on the 9th and at Lawrenceville on the 22d.

PRECIPITATION.

The average precipitation for the State, determined from reports from 136 stations, was 4.14 inches, which is 0.15 inch in excess of the normal for the month. The greatest monthly total was 7.23 inches at Elk Lick, while the least, 1.75 inches, was recorded at the Philadelphia Weather Bureau. The greatest amount recorded in any 24 consecutive hours was 2.63 inches, at Blossville on the 25th. Snow flurries, amounting to but a trace, occurred at Butler on the 11th, at Freeland on the 13th and at Pottstown on the 23d.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII.

JUNE, 1927.

No. 6

GENERAL SUMMARY.

The temperatures were unseasonably low during the greater portion of the month with a short warm period near its close. Frosts occurred at many places on the 2d and again on the 16th, doing considerable damage to tender vegetation, but not much to the hardier crops. Severe thunderstorms occurred on the 4th with some resulting damage by lightning and some by the washing of fields, the rainfall exceeding 1.00 inch per hour in some places. A severe thunderstorm swept the Wyoming valley on the 26th, and several buildings were damaged by lightning. Considerable damage was also done by wind and excessive rainfall. Taken as a whole, the month was not very favorable for crops, and the growth was generally slow. This was especially true of corn and most truck crops. Some improvement was made during the last week. Conditions were more favorable for wheat and oats. Wheat filled well generally, and was turning color at the end of the month. There were some complaints of damage by the fly, and smut was reported in some places, but on the whole the crop seemed fair to good. Oats generally did well. The first crop of hay was mostly harvested in the southern counties by the end of the month, while cutting was in full swing elsewhere. Yields were generally good and the hay was being cured mostly in favorable weather and with small losses. Early potatoes were exceptionally fine. The striped beetles did less damage than usual and there were few reports of blight. Reports on orchard fruits were not encouraging. Early damage by frost had been heavy, and apples were falling badly. The outlook was for light yields and only fair quality. Blackberries and raspberries were the finest for several years.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 86 stations, was 63.8°, which is 4.4° below the normal June temperature in Pennsylvania. The highest monthly mean was 69.2°, at Philadelphia-Germantown, while the lowest was 55.6°, at West Bingham. Daily extremes ranged from a high of 99°, at Lewisburg on the 29th, to a low of 25°, at West Bingham on the 16th. The greatest daily range of temperature was 53°, at Lewisburg on the 29th.

PRECIPITATION.

The average precipitation for the State, as computed from the reports of 138 well-distributed stations, was 3.72 inches: a deficiency of 0.38 inch when compared with the June normal. The greatest monthly total was 6.78 inches, at Palmerton, while the least, 1.59 inches, was recorded at Erie. The greatest amount recorded in any 24 consecutive hours was 3.40 inches, at Holtwood on the 19-20th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXII.

JULY, 1927.

No. 7

GENERAL SUMMARY.

The weather for July was freakish in some respects. The temperature mean was very nearly normal, but the lowest July temperature of record in the State, 29°, occurred at West Bingham on the 5th. The rains were mostly light or moderate during the first three weeks, and were followed by a period of excessive rains on the 22-23d, and another on the 30th-31st, which brought the average for the State considerably above the July normal. Numerous excessive local rains occurred during those storms. Lykens recorded 8.04 inches in approximately 12 hours. (The heaviest rate of rainfall known for the State was 7.50 inches in 4 hours at Stroudsburg on August 1, 1913.) Damaging local storms were reported during the month as follows: In New Castle and vicinity on the night of the 6-7th, damage was done by lightning, wind, and hail to the extent of more than \$100,000. In Stroudsburg and vicinity much damage was done by wind and lightning on the 14th, many trees being destroyed and telegraph, telephone, and electric light lines broken down. Along the northern border of Cumberland County rains in excess of 6.00 inches on the afternoon and night of the 22d caused many thousands of dollars of damage for which no reliable estimates could be secured. One of the heaviest hailstorms of record in the State occurred in Johnstown and vicinity on the 21st. Hail drifted to a depth of from 2 to 4 feet in some places, and more than 2000 windows were broken in the city. The damage done by storms was exceeded many times over by the benefit of the rains to the crops which were in need of moisture in most sections previous to the 22d. Pastures and truck crops were revived at an opportune time and soon recovered from the effects of the moderate drought that had prevailed. Some wheat was damaged in the fields, although the greater portion of the crop had been hauled into barns or threshed from the shock. Oats harvest was in full swing at the time of the rains, and there was more or less discoloring of the grain, but the damage was not serious. The outlook for orchard fruits was discouraging with light yields and inferior quality generally in prospect.

TEMPERATURE.

The mean temperature for the State, computed from the reports of 85 stations, was 71.7°, a deficiency of 0.2° when compared with the July normal. The highest monthly mean was 76.6°, at Philadelphia Point-Breeze, and the lowest was 62.6°, at West Bingham. The highest temperature recorded during the month was 100°, at Lebanon on the 13th, while the lowest, 29°, occurred at West Bingham on the 5th. The greatest daily range of temperature was 54°, at Clearfield on the 1st.

PRECIPITATION.

The average precipitation for the State, as determined from the records of 139 stations, was 4.97 inches, or 0.62 inch in excess of the normal July rainfall. The greatest monthly total was 11.82 inches, at Lykens, while the least was 1.81 inches at Williamsport. The greatest amount recorded in any 24 consecutive hours was 8.04 inches, at Lykens, on the 22-23d.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII. AUGUST, 1927. No. 8

GENERAL SUMMARY.

This was the coolest August in the history of the State Weather Service, the mean temperature being 1.6° below that of August, 1912, which was the second coolest on record. The low mean was due to a moderate, but steady, deficiency throughout the month, and extremes for individual dates were not broken. However, the maximum of 92° for the State has been exceeded each August in the 40-year record. The cool nights were decidedly unfavorable for late corn, which in most cases was stunted beyond recovery. Early corn made a fair growth and development. The rainfall was below the normal at most places in the Ohio and Susquehanna basins, and was well above the normal in the Delaware basin. The excessive rains were favorable for pastures, potatoes, and truck crops, but damaged some grain and hay in the fields. In the Ohio and Susquehanna basins there was generally enough rain to preserve a healthy condition of the crops, while the weather was very favorable for field work, and especially for haying. The season, up to the end of August, was unusually good for hay. The yields were large, and the losses in curing were generally less than usual. Plowing was in progress during the latter half of the month, and a large portion of the wheat ground was prepared for seeding. The weather in August was not wholly favorable for orchard fruits. Apples developed slowly and fell from the trees more than usual. The peach crop was very light, and the fruit that was ripening at the close of the month began to rot in some instances before it was ripened enough for use. Only one severe storm was reported during the month, it being in the Perkiomen valley where the hail and high winds did considerable damage to crops, and destroyed a good many trees.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 82 stations, was 65.5°: a deficiency of 4.5° as compared with the normal and the lowest for any August since State-wide records have been kept. The highest monthly mean was 70.4°, at Philadelphia-Germantown and the lowest 59.2°, at Gouldsboro. The highest temperature recorded during the month was 92°, at Clearfield on the 1st and also at Claysville on the 7th. The lowest was 34 degrees, at three stations: Brookville on the 24th; and at Somerset and Gouldsboro on the 25th. The greatest daily range of temperature was 47°, at Brookville on the 7th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations of 135 stations, was 4.12 inches, which is 0.11 inch less than the August normal. The greatest monthly amount was 11.49 inches, at Snow Hill, while the least was 1.13 inches, at Selinsgrove. The greatest amount for any 24 consecutive hours was 4.04 inches at Snow Hill on the 13th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII. SEPTEMBER, 1927. No. 9

GENERAL SUMMARY.

September was an ideal month for out-of-door pursuits. It averaged slightly above normal in temperature and well below the average in rainfall. The first half was generally warm, with the maximum for the month, and in many sections for the entire summer, occurring on the 15th, when readings well over 90° were recorded. From the 18th to 28th temperatures were well below the seasonal average and light to heavy frosts formed in many sections on the 23d and 24th. The month closed with temperatures well above the normal. Rainfall was generally light and unevenly distributed. Some stations in the northern tier of counties reported less than a half-inch, while others in south-central sections showed an excess for the month. On the average rain fell on but six days, while twenty-five days averaged either clear or partly cloudy. A severe wind and rain storm visited portions of Delaware and Schuylkill counties on the 15th, blowing down trees and poles and unroofing several small buildings. There was no evidence of tornadic action, however. Another severe storm did considerable similar damage at Harrisburg on the 18th. Crops regained considerable of the ground lost during August, although late corn, while a large crop, was of very inferior quality and of little use except for ensilage. Pastures were good to excellent at the close of the month, but early rains would benefit them. Potatoes were good in most sections, although rot was increasing to some extent. Tobacco, while not so good as last year, was reported as fair to good. Unfavorable weather conditions during August affected the apple crop to a great extent and the crop at best is only fair. Truck crops, except sugar corn, were plentiful and appeared to be the best for several seasons.

F. H. A.

TEMPERATURE.

The mean temperature for the State, as determined from reports of 84 stations, was 64.9°, or 0.9° in excess of the September normal. The highest monthly mean was 70.0°, at Donora, and the lowest, 56.8°, was recorded at Gouldsboro. The highest temperature recorded during the month was 97°, at Vandegrift on the 15th, while the lowest for the month occurred at two stations: Brookville and Somerset, on the 24th. The greatest daily range of temperature was 51°, at Carlisle, on the 25th.

PRECIPITATION.

The average precipitation for the State, deduced from reports of 136 well-distributed stations, was 2.08 inches, a deficiency of 1.40 inches as compared with the normal September rainfall in Pennsylvania. The greatest monthly total was 7.00 inches, at Lancaster, and the least, 0.20 inch at Wellsboro. The greatest amount registered in any 24 consecutive hours was 6.60 inches, at Lancaster during the storm of the 18-19th.

The departures from normal temperature and precipitation are computed only from records for stations that have ten or more years of observation, but all complete reports are used in determining means for the State. † On other dates also.

Reference letters, a, b, c, etc., indicate, respectively, 1, 2, 3, etc., days missing from the record. T, indicates precipitation less than .01 inch, rain or melted snow
 !! Post-Office addresses are as follows: of Beaver Dam, Beaver; of Elk Lick, Salisbury; of Ingram, Crafton, Pittsburgh; of Lycippus, Greensburg; of Neshaminy, Oak-
 ford; of Sharon, Farrell; of Shawmont, Manayunk; of West Bingham, Genesee.

Daily Precipitation for September, 1927

GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII. OCTOBER, 1927. No. 10

GENERAL SUMMARY.

October was an unusual month with the temperature and precipitation both above the normal. The temperature excess was moderate, but fairly uniform, and averaged 3.2°. The rainfall excess was large excepting in a few northwestern counties where there was a slight deficiency. A fairly large number of stations recorded rainfalls more than twice as great as their normals. These rains caused floods in a few streams, with some damage, and filled other streams bank full. In South Scranton the flood waters filled basements, and covered the first floors of a good many homes, while in Kirby Park, Wilkes-Barre, the damage was estimated at \$10,000. From 2.0 to 3.0 inches of snow fell in Somerset County on the 18th. Despite the heavy rainfall, there was the usual amount of fair and fine October weather with the sunshine above the normal in most sections. The heavy rains made the fields muddy, and caused serious delays in finishing up of fall work. Plowing was difficult, or impossible, in most sections while potatoes that remained in the ground sustained heavy losses by rotting. Most of the wheat was sown before the heavy rains began, and made an excellent growth, while the mild temperatures, in conjunction with ample moisture, helped to prolong good pasturage beyond the usual time. The rains did not interfere with the gathering of the winter apples, and a larger quantity than anticipated was stored in most sections. Many kinds of late truck were good nearly through the month, and an unusually fine crop of celery was matured.

TEMPERATURE.

The mean temperature for the State, as determined from reports of 83 stations, was 55.6°, or 3.2° above the normal for October. The highest monthly mean was 60.5°, at Philadelphia-Germantown, while the lowest, 49.0°, was reported from Gouldsboro. The highest temperature recorded during the month was 99°, at Carlisle on the 1st, a new State record for October, and the lowest was 21°, at Gouldsboro, on the 30th. The greatest daily range of temperature was 54°, at Bradford on the 25th, and also at Clearfield on the 27th.

PRECIPITATION.

The average precipitation (from rain and melted snow) for the State, as deduced from observations at 136 well-distributed stations, was 6.40 inches. This is 3.22 inches in excess of the monthly normal and a new record for October. The greatest monthly amount reported was 11.91 inches at Paupack, also a new State record for the month. The least was 1.58 inches, at Sharon. The greatest amount recorded in 24 consecutive hours was 3.84 inches, at Pottsville on the 3d-4th. Snowfall for the State averaged 0.1 inch, which coincides with the October normal. The greatest monthly snowfall was 3.0 inches, at Somerset, which amount fell on the 18th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII.

NOVEMBER, 1927.

No. 11

GENERAL SUMMARY.

The month as a whole was unusually mild, the temperature being above the normal on 19 days. The week comprising the 4th to 10th inclusive was moderately cold, while minimum temperatures for the month were recorded at most places during a short cold period from the 19th to 21st inclusive. A temperature of 85° at Clearfield, on the 1st, establishes a new high record for November in Pennsylvania. The month closed with temperatures 20° or more above the normal. Rains were of frequent occurrence, there being an average of 14 days with 0.01 inch or more of precipitation. However, the excessive rainfall was due chiefly to three periods of heavy rains. The first of these occurred on the 3d and 4th, the second period on the 17th and 18th, and the last period from the 27th to 29th inclusive. During the second period of heavy rains there were many severe local storms. A tornado swept the Oley valley in Berks County on the 17th causing damage estimated at upwards of \$200,000. No loss of life was reported. A total rainfall of 11.36 inches at Bradford establishes a new high precipitation record for November in Pennsylvania. The rainy weather with the resultant muddy fields caused considerable delay in finishing up the fall work, and it also caused some losses of crops in the field. Some potatoes remained in the ground when the first period of heavy rains occurred, and they were nearly a total loss. Corn was kept too wet to crib and husking was consequently slow. Many farmers hauled the corn from shocks in the field and stored it near their barns to be husked at favorable times during the winter. Pasturage was fair to good at most places during the first half of the month, or until the severe freeze of the 19th to 21st, to be more exact.

TEMPERATURE.

The mean temperature for the State, as determined from reports of 84 stations, was 46.2°, or 5.2° above the November normal. The highest monthly mean was 51.2°, at Philadelphia-Germantown, and the lowest, 40.6°, was recorded at Wellsboro. The highest temperature recorded during the month was 85° at Clearfield on the 1st, and the lowest for the State was 10°, at Bradford on the 8th and also at Somerset on the 29th. The greatest daily range of temperature was 45°, at Muncy Valley on the 1st.

PRECIPITATION.

The average precipitation, from rain and melted snow, as deduced from observations at 135 well-distributed stations, was 4.95 inches; an excess of 2.14 inches as compared with the normal for the month. Monthly totals ranged from a maximum of 11.36 inches at Bradford to a minimum of 2.21 inches at Harrisburg. The greatest amount recorded in any 24 consecutive hours was 3.24 inches, at Lansford on the 17-18th.

Snowfall for the State averaged 1.8 inches, or 0.8 inch less than the monthly normal. The greatest total snowfall was 16.6 inches, at Erie, of which 7.4 inches fell in one storm on the 19th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXII. DECEMBER, 1927. No. 12

GENERAL SUMMARY.

This was a month of mostly mild temperatures, the cold periods being of short duration, and not very severe. The coldest period in most parts of the State was the 9th and 10th, when temperatures averaged from 10° to 15° below the normal. The precipitation for the month was heavy, but the snowfall was only about one-half of the December normal. Most of the snow fell during the middle of the first week, and had nearly disappeared in the southeastern counties by the end of the week. The ground was generally bare in the chief winter wheat growing regions when the cold period occurred on the 9th and 10th, and the frost penetrated to a considerable depth. This was followed by an unusually mild period from the 12th to the 16th inclusive, during which the frost came out of the ground again in the greater portion of the State, and farmers started plowing. Another hard freeze occurred from the 24th to the 26th inclusive, and was followed by unseasonably mild conditions during the remainder of the month. This alternate action of freezing and thawing without snow cover resulted in some damage to winter wheat, especially on heavy soils. The extent of the damage cannot be estimated for some time to come. The monthly precipitation of 8.93 inches at Grove City has been exceeded in December only twice in the last forty years. There were no severe or damaging storms during the month. On the night of the 3d and 4th an ice coating formed on paved roads in some parts of the State and was followed by a deposit of sleet that made the roads skiddy and almost impassible for about 24 hours, when a rapid melting occurred and facilitated the scraping of the main highways.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 83 stations, was 32.7°, an excess of 1.6° as compared with the normal. The highest monthly mean was 38.9°, at Philadelphia Weather Bureau, and the lowest was 26.5° at Gouldsboro. Extremes for the month ranged from a maximum of 73° at Newell on the 1st to a minimum of 6° below zero at Bradford on the 25th. The greatest daily range of temperature was 49°, at Claysville and Pittsburgh on the 8th.

PRECIPITATION.

The average precipitation, (from rain, sleet and melted snow) for the State, computed from reports of 132 stations, was 4.41 inches, or 1.18 inches greater than the normal for December. The greatest monthly total was 8.93 inches, at Grove City, while the least, 2.16 inches, was recorded at Center Hall. The greatest amount recorded in any 24 consecutive hours was 2.94 inches at Grove City on the 13th. Sleet in amounts varying from trace to over 2 inches fell in the southeastern portion of the State on the 4th. The average snowfall for the State was 4.5 inches, or just about half the normal December amount. The greatest monthly snowfall was 26.4 inches at Corry. The greatest 24-hour snowfall was 6.0 inches and fell at several stations on the 2d, 17th, 19th and 20th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION,
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXII. ANNUAL SUMMARY, 1927. No. 13.

GENERAL SUMMARY.

The year as a whole was marked by a moderate excess in both temperature and precipitation, while the crop growing season, April to September inclusive, was deficient in both. January was mostly seasonable, and the only event of importance during the month was a moderate flood in the Pittsburgh river district. This was followed by unusually mild conditions in February, the excess in temperature over the normal being 7.3°. However the snowfall was much heavier than the February average. March was also a mild month, although the temperature excess was not so great as for February. The snowfall in March was very light. At the end of the month the wheat fields were green, and were mostly in good condition. There was some winter killing of late sown wheat on heavy soils. April was generally seasonable excepting a cold period with frosts near the end of the month. Field work made good progress, but crop growth was a little slow in starting. Wheat fields generally improved, and many that were more or less spotted at the end of March filled in and presented a fairly good appearance at the end of April. Alfalfa wintered well, and was unusually promising. There was some winter killing of clover on heavy soils. Oats seeding was well advanced in the southern counties at the close of the month, and corn ground was being plowed and prepared for planting. May weather was generally seasonable until the last week which was intensely cold with frosts that killed considerable tender vegetation and damaged orchard fruits. The growth of truck crops was effectually checked. Wheat, alfalfa, and pastures made a good growth. June was among the coldest on record, being surpassed only by those of 1903, 1907, and 1916. Light frosts occurred in some places on the 2d and again on the 16th. Corn and truck crops grew slowly, but wheat and the hay crops did well. The first cutting of hay was good in yield and quality. Wheat was turning color at the end of the month, and the crop was promising. Orchard fruits were in poor condition. July was a month of seasonable temperatures with a moderate excess in rainfall. The excess was just enough to balance the accumulated deficiency for the year to that time. Crop conditions generally improved during the month. A good crop of wheat was harvested early in the month, and later some of it was damaged in the fields by heavy rains. Oats harvest was in full swing when the heavy rains occurred, and most of the grain was more or less discolored. August was the coolest on record, and was very unfavorable for late corn. Early planted corn matured in fairly good condition, but ears did not form on late corn and much of it was harvested for ensilage. The second cutting of hay was unusually heavy. Truck crops did fairly well. Pastures were excellent. September furnished a moderate excess in temperature but a large deficiency in rainfall. Much fair weather was favorable for field work. Potatoes and late truck crops were good. October and November were warm and rainy, the rainfall for October averaging practically twice the normal amount. The fields were muddy and plowing and wheat seeding were difficult. December showed a moderate excess in both temperature and precipitation. A disagreeable sleet storm occurred on the 4th, and delayed traffic for about 36 hours. The year as a whole was favorable for all crops excepting corn and orchard fruits. The hay crop was one of the heaviest on record.

JANUARY, 1928.

No. 1

GENERAL SUMMARY.

January was mild except for cold periods near the beginning and near the end of the month respectively. A large temperature excess accumulated from the 6th to the 15th inclusive. The frost went out of the ground, and plowing was reported from many places in nearly all parts of the State. There was much fair weather during the month that was favorable for outdoor pursuits and pastimes, and on the whole it was an unusually pleasant winter month. The winter grains were in fair to good condition at the beginning of the month, and few complaints were received of damage by the first cold period, although there was little or no snow covering on the fields. There was no snow covering on the fields of the southeastern counties until the 28th, when a heavy snowstorm occurred. Coatesville reported 20.0 inches of snow at that time, and many stations reported amounts from 10.0 inches upward. The snowstorm was immediately followed by a moderate cold wave of about 48 hours duration, and the temperature rose to near the normal again at the close of the month. The usual January ice harvest did not materialize to any extent. There were no damaging storms during the month, and the big snowstorm, which delayed traffic to more or less extent, was the only disturbance of consequence. The snowfall for the State as a whole was less than two-thirds of the January normal, and in some of the northern, western, and southwestern counties it was extremely light. However it was fairly heavy in the northwestern counties of Warren, Crawford, and Erie. As a result of the rainfall being generally below the normal, the streams remained at moderate stages throughout the month although the water supply was ample for all needs. Live stock was generally reported to be in good condition and wintering well at the close of the month.

TEMPERATURE.

The mean temperature for the State, as determined from reports of 83 stations, was 29.8°, which is 2.0° above the January normal. The highest monthly mean was 35.6°, at Philadelphia Weather Bureau, while the lowest was 23.5°, at Gouldsboro. The highest temperature recorded during the month was 65°, at George School on the 8th, Arendtsville on the 14th, and also at Newell on the 14th and 15th. The lowest for the State was 23° below zero, at Gouldsboro on the 30th. The greatest daily range of temperature was 48°, at Quakertown on the 30th.

PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, as deduced from observations taken at 133 stations, was 2.08 inches, a deficiency of 1.25 inches as compared with the monthly normal. The greatest monthly amount was 4.48 inches, at York Haven, and the least was 0.78 inch, at Donora, Greensboro and Wellsboro. The greatest amount recorded in any 24 consecutive hours was 2.00 inches, at Coatesville on the 28-29th. Snowfall for the State averaged 6.8 inches or 4.2 inches less than the normal January amount. The greatest amount for the month was 31.7 inches, at Corry, and the greatest 24-hour snowfall was 20.0 inches at Coatesville on the 28-29th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXIII.

FEBRUARY, 1928.

No. 2

GENERAL SUMMARY.

The month as a whole was comparatively mild, the cold periods being of short duration and not very severe. It was moderately cold on the 19th, 21st, 25th and 26th, while during the remainder of the month the temperatures were near or somewhat above the normal. The precipitation was moderately heavy, although the snowfall was considerably less than the February average. The heaviest snowfall occurred on the Pocono plateau and in the eastern portion of the Ohio drainage basin. In the south-central and southeastern counties the fields were bare of snow covering the greater portion of the month, and the conditions were unfavorable for winter wheat and rye. Near the end of the month disparaging reports were received in increasing numbers, and it became apparent that the alternate freezing and thawing without adequate snow protection had seriously damaged the winter grains. This damage was believed by some to be the worst that had occurred during the last six or seven winters. No complaints were received regarding damage to clover or alfalfa, probably because it is not so apparent until growth begins in spring, but those crops undoubtedly suffered considerably. Little outdoor work was done by the farmers during the month excepting the pruning of orchards and the hauling of manure. There were no severe storms and the main highways were in fair to good condition most of the time. During periods of mild temperature, covering about one-half of the month, the frost came out of the top soil, leaving some in the subsoil, and rains made the unimproved roads almost impassable. At such times it was impossible to drive into the fields. Building and construction work proceeded at a moderate rate, with occasional interruptions, throughout the month, and more was accomplished than during the average February.

TEMPERATURE.

The mean temperature for the State, as determined from the records of 82 stations, was 30.3°, an excess of 2.6° over the February normal. The highest monthly mean was 35.5° at Philadelphia-Point Breeze and the lowest was 23.1°, at Gouldsboro. The highest temperature recorded during the month was 65°, at Chambersburg on the 4th, and at Hyndman on the 4th and 8th. The lowest for the month was 11° below zero, at Bradford on the 26th. The greatest daily range of temperature was 53°, at Stroudsburg on the 23d.

PRECIPITATION.

The average precipitation for the State, as deduced from the reports of 132 stations, was 3.42 inches, which is 0.76 inch greater than the normal for the month. The greatest monthly amount was 5.39 inches at Creekside, while the least, 1.62 inches, fell at Erie. The greatest amount recorded in any 24 consecutive hours was 2.25 inches, at Center Hall on the 14th. Snowfall for the State averaged 6.7 inches, or 3.7 inches less than the normal amount for February. The greatest total snowfall was 21.2 inches, at Kregar, in Westmoreland county, and the greatest 24-hour snowfall was 12.0 inches, at Unity Reservoir, also in Westmoreland county, on the 18th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII.

MARCH, 1928.

No. 3

GENERAL SUMMARY.

This was nearly a normal month in both temperature and precipitation, there being a slight deficiency in both elements. The coldest period during the month was from the 4th to the 6th inclusive, but during that time no unusually low temperatures for the season were recorded. Temperatures slightly below zero were reported from Montrose and Brookville. A decidedly mild period covered the 24th to the 26th inclusive with temperatures 20° or more above the normal, but no records were broken. The precipitation was comparatively light during the first half of the month, followed by an unusually heavy snowstorm on the 17th and 18th, during which there was a snowfall of 12.0 inches or more at a large number of stations. The snow melted rapidly during the warm period, before mentioned, and little remained by the night of the 26th. After the big snowstorm the precipitation was light and local until the 30th when a heavy, general rain was mixed with sleet, and a heavy glaze deposit occurred in many of the mountain districts, breaking numerous telegraph and telephone wires, and damaging trees in some places. The total snow and sleet deposit for the month averaged about 50 per cent above the March normal. The lack of snow covering during the first half of the month resulted in further damage to winter grains that had suffered more or less during January and February, and as a result their condition at the end of March was rated the lowest for many years. It was apparent that an unusually large acreage would have to be plowed under and seeded to other crops. Clover was also damaged considerably. Little field work was done during the month except the hauling of manure and pruning of orchards, but during the last half of the month farmers were generally making the preliminary preparations for spring work. Plowing was begun in some places near the end of the month.

TEMPERATURE.

The mean temperature for the State, as deduced from observations of 85 stations, was 37.0°, which is 0.5° lower than the March normal in Pennsylvania. The highest monthly mean was 42.0°, at Hanover, Philadelphia Weather Bureau and Philadelphia-Germantown. The lowest monthly mean was 28.6° at Gouldsboro. The highest temperature recorded during the month was 82°, at Newell on the 13th, while the lowest, 3° below zero, occurred at Brookville on the 5th. The greatest daily range of temperature was 59°, at Montrose on the 24th.

PRECIPITATION.

The average precipitation for the State, as determined from reports of 133 well-distributed stations, was 3.24 inches, or 0.30 inch less than the monthly normal. The greatest monthly total was 5.45 inches at Elk Lick and the least, 1.65 inches at Ansonia. The greatest amount recorded in any 24 consecutive hours was 2.11 inches, at Creekside on the 29-30th. Snowfall for the month averaged 14.5 inches, which is over twice the normal for March. The greatest monthly snowfall was 39.0 inches at Elk Lick. The greatest 24-hour fall was 16.0 inches, at Somerset on the 17-18th.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. APRIL, 1928. No. 4

GENERAL SUMMARY.

The month averaged considerably below normal in temperature and well above in precipitation. The first week was warm, with temperatures well up in the eighties at several stations, but the last three weeks were almost continuously subnormal, with frosts and freezing temperatures persisting until near the close of the month. The average precipitation, 5.50 inches, establishes a new record for April in Pennsylvania, the previous wettest April being 5.41 inches in 1901. The average snowfall, while not the greatest of record for the month, was more than twice the normal amount. The greatest portion of the snow fell in the storm of the 27-28th, when falls exceeding 15 inches were recorded at several stations in the western and south-central counties, with a total for the two days of 31.0 inches at Somerset. This snow was very moist and had practically disappeared in all parts of the State at the end of the month. The storm caused considerable damage and many communities were cut off from the outside world for several hours, due to wires snapping under the weight of the heavy snow deposit. Due to the continued subnormal temperatures during the last three weeks of the month vegetation made little progress but no serious frost damage was reported. Wheat was damaged by winter killing, particularly in the western part of the State and considerable wheat was plowed under and sown to oats and corn during the month. At the end of the month oats seeding was well advanced in the southeastern counties, with some of the first seedlings coming up. Early gardens made little progress and considerable seed seems to have rotted in the ground. Fruit trees remained dormant longer than is usual and thus escaped serious damage that might have resulted if they had bloomed at the normal time. Small fruits appeared to be in good condition at the end of the month. Pastures and meadows were in fair to good condition and growing slowly.

F. H. A.

TEMPERATURE.

The mean temperature for the State, as deduced from observations taken at 84 stations, was 46.0°, or 2.8° less than the normal for the month. The highest monthly mean was 50.6° at Philadelphia Weather Bureau and the lowest was 39.8° at Gouldsboro. The highest temperature recorded during the month was 88°, at Bradford on the 7th, and the lowest was 11°, at Brookville and Elk Lick on the 16th. The greatest daily range of temperature was 52 degrees at three stations:—Claysville on the 18th; Phoenixville on the 20th and George School on the 26th.

PRECIPITATION.

The average precipitation for the State, as determined from observations at 134 well-distributed stations, was 5.50 inches, or 2.13 inches in excess of the April normal. The greatest monthly amount was 9.82 inches, at Somerset, while the least, 2.11 inches, fell at Sharon. The greatest amount recorded in any 24 consecutive hours was 4.08 inches at Somerset during the storm of the 27-28th. Snowfall averaged 6.5 inches, which is 3.7 inches greater than the monthly normal. The greatest total snowfall for the month was 38.5 inches at Somerset. The greatest 24-hour fall reported was 26.0 inches at Carlisle on the 27-28th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. MAY, 1928. No. 5

GENERAL SUMMARY.

The month as a whole was moderately cold and dry, deficiencies in both temperature and rainfall being reported from all parts of the State. The soil was completely saturated by melting snows at the close of April, and consequently the shortage in rainfall during May was not harmful to crops. A few complaints of dry top soil were received near the end of the month. The deficiency in temperature was just enough to make for a slow germination of corn and of some truck crops. The conditions were generally favorable for grains and grasses, and good growths were reported. Wheat continued to improve, and, except for the large number of fields that were spotted by winter killing, the crop was good. It was beginning to head at the close of the month. Oats seeding was practically finished in the southern counties during the first week, and early sown fields were coming up. The first cutting of alfalfa was ready for harvest at the end of the month, and was generally promising. Early field potatoes came up nicely and were being cultivated. Orchard fruits were reported in all conditions from very poor to excellent. Late frosts damaged or killed the fruit in localities. In some places it was unharmed, while in others it was almost a total loss. The berry crop was very promising, and strawberries were coming to market at the close of the month. The only damage by weather conditions was a heavy hail storm in Snyder and Juniata counties on the 22d. It covered an area about a mile in width and ten miles in length and seriously damaged wheat fields and orchards, while the accompanying winds tore up large trees and did some damage to buildings. The total losses were estimated at upwards of \$15,000. Melting snows flooded many streams at the beginning of the month, but did little damage outside of Pittsburgh, where the losses were estimated to be about \$2000.

TEMPERATURE.

The mean temperature for the State, as shown by reports from 85 stations, was 58.0°, or 1.5° less than the May normal. The highest monthly mean was 62.4°, at Philadelphia-Weather Bureau and also at Philadelphia-Germantown, while the lowest, 50.7°, was recorded at Mount Pocono. The highest temperature recorded during the month was 95°, at Lancaster on the 4th, and the lowest, 20°, at Ridgway and Somerset on the 13th. The greatest daily range of temperature was 59°, at Bradford on the 4th.

PRECIPITATION.

The average precipitation for the State, as computed from observations of 135 stations, was 2.23 inches: a deficiency of 1.76 inches as compared with the monthly normal. The greatest monthly total was 5.10 inches, at York Haven, and the least 0.65 inch at Erie. The greatest amount recorded in any 24 consecutive hours was 3.00 inches, at Franklin on the 17th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. JUNE, 1928. No. 6

GENERAL SUMMARY.

The temperatures were almost constantly below the normal throughout the month, while the rainfall was the heaviest for any June during the last forty years. Damage by winds, heavy rains, and hail was reported from Juniata, Perry, Cumberland, and York counties. A severe wind storm, near Newville and Bloer-ville on the 25th, damaged or destroyed many buildings, uprooted many trees, and beat down a considerable amount of grain and corn. Most crops were backward at the end of May, the temperatures having been too low for a normal growth. Corn, tobacco and the truck crops were most affected by the temperature deficiency, while wheat, rye, and most grasses made a fair growth and were only slightly below the normal. Continued low temperatures in June were therefore unfavorable, although an increased amount of sunshine during the third week started a little better growth of all crops. The first cutting of alfalfa was made early in the month, the yields being good, but there was some losses in curing. Haying continued during the third week under more favorable conditions, and with almost no losses. Pastures were good throughout the month. Frequent rains after the third week delayed field work very much. Haying was impossible, and cultivation made but little progress. The heads of wheat and rye were filling rapidly near the end of the month, and seemed to be normally advanced. Potatoes were good to excellent, the vines being heavy and undamaged by beetles or the blight. Tobacco and truck crops improved considerably during the last week when the temperatures more nearly approached the normal, and were generally fair to good excepting the weedy condition of many fields. Orchard fruits were in all conditions, from very poor to good, while the berry crop was unusually good.

TEMPERATURE.

The mean temperature for the State, as determined from observations at 85 stations, was 65.5°, which is 2.7° below the normal for the month. The highest mean was 70.6°, at Philadelphia-Point Breeze, and the lowest was 58.8°, at Mount Pocono. During the month the temperature ranged from a maximum of 93° at Phoenixville on the 14th to a minimum of 30° at Wellsboro on the 12th. The greatest daily range of temperature was 52° at Wellsboro on the 12th.

PRECIPITATION.

The average precipitation for the State, as shown by reports from 139 stations, was 7.96 inches, or 3.86 inches in excess of the June normal. The greatest monthly total was 13.14 inches, at West Chester, and the least was 3.96 inches, at Erie. The greatest amount recorded in any 24 consecutive hours was 4.80 inches, at West Chester on the 6th.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. JULY, 1928. No. 7

GENERAL SUMMARY.

The temperatures averaged slightly above the normal with no unusual extremes. The rainfall excess was approximately twenty-five per cent, and was occasioned chiefly by heavy local storms that did considerable damage. On the 4th local storms did much damage in Allegheny County, chiefly southeast of Pittsburgh. At Rainbow Gardens and Olympia Park, 400 automobiles were destroyed in landslides, and 2000 persons were marooned by flood waters. Lightning struck a storage house and a church, resulting in damages of more than \$5000. On the 11th, heavy rains flooded Mill Creek in Westmoreland County, destroying a bridge and filling many cellars in the villages of Oak Grove and Waterford. On the same date a severe hail-storm occurred in Franklin County, doing much damage over a narrow path. On the 20th, a local storm, quite evidently a tornado, occurred near Mifflintown. Destruction was almost complete, at intervals, over a narrow path for several miles. No estimates of the amount of damage were received. On the 22d much damage was done in Carlisle and vicinity by wind, hail, and lightning, although the rainfall was not very heavy. Hail did heavy damage to greenhouses, to windows in other buildings, and to crops in the vicinity of Carlisle. The total losses were upwards of \$25,000. The wind tore up large trees, damaged many roofs, and leveled many cornfields. Lightning struck several buildings and did considerable damage. There were some evidences of tornadic action in this storm, although no funnel cloud was seen. Aside from the damage by local storms, the month was favorable for growing crops. Corn made rapid progress. Wheat was mostly threshed or hauled into barns, with some damage in the fields by heavy rains. Oats harvest was nearly finished in the southern counties. Hay-making progressed slowly with some losses in curing, but with heavy yields reported. Potatoes and truck crops were unusually good.

TEMPERATURE.

The mean temperature for the State, as shown by reports from 83 stations, was 72.8°, which is 0.9° above the July normal. The highest mean was 77.6°, at Philadelphia-Point Breeze, while the lowest, 65.8°, was recorded at Mount Pocono. The highest temperature recorded during the month was 96°, at Phoenixville on the 4th; at Claysville and Mauch Chunk on the 8th; at Carlisle on the 11th and at Lancaster on the 20th. The lowest for the month was 40°, at Bradford on the 30th and 31st and also at Gouldsboro on the 31st. The greatest daily range of temperature was 45°, at Bradford on the 8th.

PRECIPITATION.

The average precipitation for the State, as determined from observations taken at 136 well-distributed stations, was 5.44 inches: an excess of 1.09 inches over the monthly normal rainfall. Monthly totals ranged from a maximum of 11.81 inches at Quakertown to a minimum of 2.37 inches at Philadelphia-Point Breeze. The greatest amount recorded in any 24 consecutive hours was 4.68 inches at Quakertown on the 13th and 14th.

GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. AUGUST, 1928. No. 8

GENERAL SUMMARY.

With two exceptions, 1900 and 1918, this was the warmest August during the last 41 years, and yet the maximum temperature for the State was only 99°. The heat was steady, and with generally high humidity resulted in oppressive and uncomfortable conditions. With the rainfall above the August average, the high temperatures made for a rapid growth of all crops. However, it also caused a rapid growth of weeds, and since the frequent rains delayed cultivation, the result was many weedy fields. Rains damaged oats in shock to some extent, and caused some losses of hay in the curing. However, the hay crop was so heavy that the losses did not reduce the yield of good hay below the normal. The conditions seemed to be decidedly favorable for potatoes, and at the end of the month the Federal-State Crop Reporting Service estimated the largest crop ever grown in the State. There was practically no blight in the early crop, while in the late varieties it was confined to a few counties. Truck crops of nearly all kinds were unusually good. Early peaches ripened during the latter part of the month, and were plentiful on the market. The quality was fair to good. Apples fell from the trees a little more than usual on account of excessive rains. A few damaging storms occurred during the month, but no more than are common to August. The most severe storms occurred on the 10th, and the regions of greatest damage were Towanda and vicinity, and Lancaster and vicinity. In the former region 12 small bridges were reported destroyed by high water, and the crop damage was considerable. In Lancaster and vicinity heavy hail damaged crops, especially tobacco, while winds and lightning destroyed several buildings. On the 30th a man was killed in Philadelphia by lightning, while high winds uprooted many large trees.

TEMPERATURE.

The mean temperature for the State, as deduced from reports of 84 stations, was 73.4°, which is 3.4° above the normal August temperature. The highest monthly mean was 77.8°, at Philadelphia-Navy Yard and the lowest was 67.6°, at Mount Pocono. The highest temperature recorded during the month was 99°, at Phoenixville on the 4th, and the lowest was 35°, at Ridgway on the 13th. The greatest daily range of temperature was 47°, at Muncy Valley on the 30th and 31st.

PRECIPITATION.

The average precipitation for the State, as shown by observations taken at 135 stations, was 4.60 inches: an excess of 0.37 inch as compared with the monthly normal. The greatest monthly amount was 10.87 inches, at Hawley, while the lowest was 1.32 inches at Beaver Falls. The greatest amount recorded in any 24 consecutive hours was 5.28 inches at Coatesville on the 16-17th.

The departures from normal temperature and precipitation are computed only from records for stations that have ten or more years of observation, but all complete reports are used in determining means for the State. † On other dates also.

† On other dates also.

Reference letters, ^a, ^b, ^c, etc., indicate, respectively, 1, 2, 3, etc., days missing from the record. T, indicates precipitation less than .01 inch, rain or melted snow.

†† Post-Office addresses are as follows: of Beaver Dam, Beaver; of Elk Lick, Salisbury; of Ingram, Crafton, Pittsburgh; of Lycippus, Greensburg; of Neshaminy, Oakford; of Sharon, Farrell; of Shawmont, Manayunk.

Daily Precipitation for August, 1928

PHILADELPHIA, PA.

VOL. XXXIII. SEPTEMBER, 1928. No. 9

GENERAL SUMMARY.

There was much chilly and disagreeable weather in contrast with the pleasant conditions that usually prevail during September. Frosts or freezing temperatures covered more than one-half of the State, and damaged or killed tender vegetation. Hardy plants survived and continued to grow, and at the end of the month large quantities of late truck crops were still available. A heavy wind storm with more or less rain, the remains of a destructive tropical storm, wrought heavy damage to the tomato crop on the 19th, and in some places there were few if any tomatoes left on the vines. This storm also beat down a large amount of corn although it did not destroy much of the grain. It tore up many large trees, and caused a considerable loss in apple orchards. A local thunder and wind storm crossed Lancaster County on the 13th and did considerable damage. Many buildings were unroofed, and a few were wrecked. During the fourth week snow flurries were observed at many places in the northern counties and in the mountain districts. Field work made fair progress during the month. Wheat seeding was in full swing during the last ten days, and was well advanced in the southern counties at the close of the month. Silo filling and potato digging were also among the chief field operations, and much corn was cut and shocked. The corn crop was generally reported as fair, and the potato crop was unusually good. Orchard fruits were much better than last year, but were still far below the average in yields although the quality was generally good. Pastures held up well to the close of the month and furnished ample feed, but there were numerous reports of rain needed near the end of the month.

TEMPERATURE.

The mean temperature for the State, as shown by reports from 84 stations, was 60.4°, a deficiency of 3.6° as compared with the September normal. The highest monthly mean was 65.6°, at Philadelphia-Germantown, and the lowest 54.6°, at Gouldsboro and Ridgway. Extremes for the month ranged from a maximum of 94°, at Lykens on the 14th, to a minimum of 25°, at Gouldsboro on the 25th. The greatest daily range of temperature was 48°, at Ridgway on the 2d.

PRECIPITATION.

The average precipitation for the State, as determined by reports from 135 well-distributed stations, was 2.33 inches, which is 1.15 inches less than the monthly normal. The greatest monthly amount was 5.73 inches, at Gettysburg, while the lowest, 0.71 inch was reported from Beaver Falls. The greatest amount recorded in any 24 consecutive hours was 1.72 inches, at Snow Hill on the 2-3d. Traces of snow fell at several stations, the earliest reported occurring on the 17th at Mount Pocono.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. OCTOBER, 1928. No. 10

GENERAL SUMMARY.

There was much fair weather and bright sunshine during the month. The temperatures were mostly above the normal with no frosts of consequence until near the end of the month. Late corn and truck crops that survived the frosts of late September were therefore enabled to mature without material damage. The shortage in rainfall was more or less unfavorable for pastures in the western portion of the State where the September rains were deficient, while in the eastern counties where the September rains were heavier, the soil generally retained enough moisture to preserve late feed in good condition. The fair weather and mild temperatures were highly favorable for field work which progressed almost without interruption. Wheat seeding and silo filling were finished early in the month at most places. Potato digging continued throughout the month, but was nearly finished at its close. The yields were light or moderate in some counties, but for the State as a whole it was generally estimated to be the largest crop on record. Corn husking and the hauling of fodder were the chief occupations on the farms after the middle of the month. The corn crop was generally satisfactory. Winter apples were mostly gathered during the month. They were of about average quality, but yields were mostly below the normal. Grapes were unusually good, and some large yields were reported. There were no severe or damaging storms during the month. The winds were mostly light or moderate, thunderstorms were few and of moderate intensity, and no excessive rainfalls were reported. Considered from every viewpoint, it was as pleasant and favorable an October as has occurred for several years.

TEMPERATURE.

The mean temperature for the State, as shown by reports from 84 stations, was 55.1°, which is 2.7° above the October normal. The highest temperature recorded during the month was 91°, at Claysville on the 11th, and the lowest was 15°, at Gouldsboro on the 27th and at Elk Lick on the 30th. The greatest daily range of temperature was 56°, at Corry on the 11th.

PRECIPITATION.

The average precipitation (from rain and melted snow) for the State, as determined from reports of 134 stations, was 1.78 inches: a deficiency of 1.40 inches as compared with the monthly normal. The greatest monthly amount was 5.24 inches at Warren and West Newton, while the least, 0.43 inch, was recorded at Hamburg. The greatest amount recorded in any 24 consecutive hours was 2.00 inches, at Clearfield on the 17-18th. Snowfall averaged 0.1 inch, which coincides with the October normal for Pennsylvania. The greatest monthly amount was 1.5 inches at Warren, all of which fell on the 29th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. NOVEMBER, 1928. No. 11

GENERAL SUMMARY.

The temperature was above the normal about two-thirds of the time during November, and the third week was decidedly warm. There was more cloudiness but less rainfall than usual, while the snowfall was less than the November normal in the greater portion of the State. Heavy snows occurred in Somerset and Cambria and some of the northern counties. The high temperatures of the third week broke up with severe local storms that did serious damage in many places. The greatest damage was reported from a narrow belt extending eastward from northern Montour County to the city of Wilkes-Barre. From the descriptions of this damage it seems probable that the storm was a tornado although no one reported seeing a funnel. A few houses and barns were completely demolished, while a large number were unroofed or otherwise seriously damaged. In Wilkes-Barre twelve persons were injured, but no deaths were reported. In other regions many forest trees and orchard trees were uprooted and buildings were more or less damaged. A school house near Shippensburg was unroofed and the ceiling fell in, injuring the teacher and five pupils. The building was of brick with a slate roof and was in good condition before the storm. Altogether it seems to have been the most severe storm period of the year. Corn husking and the hauling of fodder progressed through the month in most sections, but were nearly finished at its close. Wheat and rye did fairly well excepting a few localities where the rainfall was insufficient for the best results, and at the end of the month they were reported to be in fair to good condition. Potato digging continued into the first week of November in some sections, but was soon finished.

TEMPERATURE.

The mean temperature for the State, as determined from observations at 85 stations, was 43.4°, which is 2.4° warmer than the normal for the month. The highest monthly mean was 49.0°, at Philadelphia Weather Bureau, and the lowest was 37.3°, at Gouldsboro. Extremes for the month ranged from a maximum of 81°, at Lancaster on the 18th to a minimum of 4°, at Montrose on the 26th. The greatest daily range of temperature was 44°, at Somerset on the 14th.

PRECIPITATION.

Precipitation, from rain and melted snow, for the State, as shown by reports from 137 well-distributed observing stations, averaged 2.32 inches, which is a deficiency of 0.49 inches as compared with the November normal. The greatest monthly total was 5.71 inches, at Westford, while the least, 1.05 inches, was recorded at Sunbury. The greatest amount recorded in any 24 consecutive hours was 1.50 inches, at Brookville on the 30th. Snowfall for the month averaged 2.3 inches, which is 0.3 inch less than the normal amount. The greatest monthly amount was 18.5 inches at Westford, and the greatest 24-hour fall was 6.0 inches, at New Castle on the 25-26th.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIII. DECEMBER, 1928. No. 12

GENERAL SUMMARY.

December was abnormally warm and dry, the temperature being above the normal about three-fourths of the time with no intense cold at any time. The precipitation averaged 36 per cent of the December normal, and was the lowest average for December during the last 40 years. The snowfall was also the lightest of record for the month of December, there being only traces in a large portion of the State. The only snows of consequence occurred in a few southeastern and a few northwestern counties. The greatest amount of precipitation for any station was 2.57 inches at Greensboro, which sets a new low record for this item. Most of the precipitation occurred from the 14th to the 18th inclusive, during a decidedly mild period, and was all in the form of rain. With very little snow covering on the fields, the winter grains suffered no material injury, as there was no deep frost, and very little heaving of the soil by freezing and thawing. At the end of the month wheat and rye were reported to be in fair to good condition. The month was unusually favorable for outdoor work. Corn husking was mostly finished, and the fodder hauled in from the fields before Christmas. Construction work of all kinds proceeded with little hindrance from weather conditions. The temperature was above freezing so much of the time, especially in the southeastern counties, that concrete could be poured with little danger from freezing. No severe or damaging storms were reported from any part of the State, and with the sunshine averaging above the normal it was an unusually pleasant and agreeable winter month.

TEMPERATURE.

The mean temperature for the State, as shown by observations taken at 84 stations, was 34.4°, which is 3.3° warmer than the December normal. The highest monthly mean was 40.8° at Philadelphia Weather Bureau, the lowest was 28.6° at Ridgway. The highest temperature during the month was 68°, at Elk Lick on the 12th, while the lowest, -2°, was recorded at Brookville on the 21st and 22d. The greatest daily range of temperature was 51°, at Elk Lick on the 12th.

PRECIPITATION.

Precipitation for the State, as determined from reports of 133 well-distributed stations, was 1.16 inches, which is 2.07 inches less than the normal December amount. The greatest monthly total was 2.57 inches at Greensboro, and the least was 0.28 inch at Lawrenceville. The greatest amount recorded in any 24 consecutive hours was 1.15 inches, at Donora on the 14-15th. Snowfall averaged but 0.9 inch, as compared with a December normal of 9.2°. The greatest monthly snowfall was 7.0 inches, at Conshohocken, all of which fell on the 8th.

PHILADELPHIA, PA.

VOL. XXXIII. ANNUAL SUMMARY, 1928. No. 13.

GENERAL SUMMARY.

Temperatures and precipitation for the year 1928 averaged near the normal although there were some fairly large monthly departures. January and February were comparatively mild with less than the normal amount of snowfall. The chief wheat growing regions of the State were bare of snow a large part of the time. This condition resulted in some damage to the wheat, especially in the western part of the State. March temperatures were mostly seasonable, while the snowfall was more than double the March normal. Most of the snow fell during an unusually heavy storm on the 17-18th. April was unseasonably cold, the last three weeks being so cold and wet that vegetation was slow in starting and field work was badly delayed. Heavy snow fell over the greater portion of the State on the 27-28th, and although it melted quickly it cooled the soil to such an extent that early planted garden seeds rotted instead of germinating. Fruit trees remained dormant longer than usual, and generally escaped frost damage. May was more favorable than April, although it was a little too cool for the best results. The soil dried out to a workable condition early in the month, and field work made good progress. Vegetation was generally doing well at the close of the month. June was cool and very rainy, the rainfall being the heaviest for any June on record. The rains made field work impossible the latter part of the month, and with the deficiency in temperature they were harmful rather than helpful to the crops. Higher temperatures prevailed in July and August, while the rainfall continued generally above the normal. This condition resulted in a better growth of crops, although it was not favorable in all respects. Damaging local storms were more numerous than usual in July, especially in the central and western portions of the State. Field work was delayed to some extent, and there were considerable losses of grain and hay in the fields due to damage by heavy rains. However, the yields of hay were so large that the losses did not reduce the supply below the normal. The conditions were especially favorable for potatoes and for truck crops. Orchard fruits did not fare so well. Apples fell from the trees more than usual, while the keeping qualities of the peach crop were seriously impaired. September was decidedly cool and dry. Frosts or freezing temperatures covered more than one-half of the State, and damaged or killed tender vegetation. About one-half of the monthly rainfall occurred on the 19-20th, during the passage of a tropical storm when much corn was beaten down by high winds and rain, and much fruit was blown from the trees, while the remainder of the tomato crop was ruined. October was a fine and pleasant month with temperatures mostly above the normal. Field work of all kinds made excellent progress. Wheat seeding and silo filling were finished early in the month, and corn husking was in full swing during the latter half of the month. An exceptionally large crop of late potatoes was gathered during the month. The temperature continued above the normal in November with more cloudiness but less rainfall than usual. High temperatures during the third week broke up with severe local storms that did serious damage in many localities. December was abnormally warm and dry, while the snowfall was the least for any December during the last 40 years. The month was free from severe or damaging storms.

VOL. XXXIV. JANUARY, 1929. No. 1

GENERAL SUMMARY.

The temperatures in January averaged near the normal with no unusual extremes. There was a slight excess at most stations in the eastern portion of the State, while a slight to moderate deficiency was reported generally from the western stations. The precipitation was mostly near the normal in all parts of the State, although the snowfall was below the January average excepting a few northwestern counties and a few localities in the mountain districts. In the southeastern counties the conditions permitted outdoor work a large part of the time, and the snowfall did not interfere with traffic. From the 23d to the 25th, inclusive, rain and sleet froze on the highways in nearly all parts of the State, and made travel conditions the most difficult and dangerous that have obtained in recent years. In the chief wheat growing sections the fields were bare of snow the greater part of the month, and frost penetrated the soil deeply. Alternate freezing and thawing of the top soil did more or less damage to the grain. The extent of the damage will be impossible to estimate until the grain starts to grow in the spring. The streams in the eastern part of the State remained at moderate stages throughout the month, while there was a fairly sharp rise at most places in the Susquehanna basin on the 20th, although nothing approaching the flood stages. In the Ohio basin there was a marked rise to near the flood stages in some places on the 20th, occasioned by rains and melting snows on the 18th and 19th. The month was comparatively free from severe or damaging storms, and there was less of the blustery and disagreeable sort of weather that obtains in the average January.

TEMPERATURE.

The mean temperature for the State as shown by reports from 85 stations, was 27.3°, or 0.5° colder than the January normal. The highest monthly mean was 34.2°, at Philadelphia Weather Bureau and also at Philadelphia-Germantown, and the lowest was 20.7°, at Ridgway. The highest temperature recorded during the month was 73°, at Newell on the 19th, and the lowest was -20°, at Brookville on the 16th. The greatest daily range of temperature was 61°, at Franklin on the 17th.

PRECIPITATION.

The average precipitation (from rain, sleet and melted snow) for the State, as determined from observations at 133 stations, was 3.37 inches, which is 0.04 inch greater than the normal for the month. The greatest monthly amount recorded was 6.86 inches, at Driftwood, while the least, 1.12 inches fell at Towanda. The greatest amount recorded in any 24 consecutive hours was 3.00 inches, at Driftwood on the 14-15th.

Snowfall for the State averaged 7.6 inches, as compared with a normal of 11.0 inches. The greatest total snowfall for the month was 25.5 inches, at Corry, and the greatest 24-hour fall was 12.0 inches, at Penn Line on the 9-10th.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.
GEORGE S. BLISS, Meteorologist.
PHILADELPHIA, PA.

VOL. XXXIV. FEBRUARY, 1929.

GENERAL SUMMARY.

Temperatures and precipitation for February averaged near to normal, there being a very slight excess in each element. Moderately cold periods centered about the 5th, 13th, and 21st respectively with no unusually low temperatures reported. The warmest periods were immediately preceding and following the last cold period. Moderately heavy snows occurred in the western and northern counties on the 6th and 7th, while the heaviest snowfall for the month was general on the 19th, 20th, and 21st. The snowfall for the month was above the February average in nearly all parts of the State, but it melted quickly in most places, and the ground was bare during the greater portion of the month. Each heavy snow caused temporary delays in traffic, but the roads were generally opened within from 36 to 48 hours. Moderately heavy rains were general near the end of the month, and caused the ice to break in most of the streams. Ice jams caused flood stages in the Allegheny river below Kittanning and at intervals down the river to Pittsburgh with only slight damage reported. A flood stage was also reached in the Schuylkill at Reading with no damage reported. Near flood stages were attained in all river districts. Light to moderate glaze storms occurred on the 6th and 10th, being most pronounced in the southwestern part of the State. The ice deposit was not heavy enough to cause much wire trouble. Little progress was made in outdoor work during the month. The ice harvest, which is chiefly carried on in the Poconos, was unusually good during last half of the month, and the ice houses were filled with a fine quality of ice. The winter grains suffered some damage by freezing and thawing while the ground was bare of snow.

TEMPERATURE.

The mean temperature for the State, as determined from reports of 85 stations, was 28.0°, or 0.3° higher than the normal for February. The highest monthly mean was 35.3°, at Philadelphia Weather Bureau, and the lowest 21.8°, at Gouldsboro. The highest temperature recorded during the month was 69°, at Claysville on the 27th, while the lowest, -20°, occurred at Brookville on the 20th. The greatest daily range of temperature was 50°, at Hawley and also at Lawrenceville, on the 24th.

PRECIPITATION.

The average precipitation for the State as shown from reports of 133 stations, was 2.87 inches, which is 0.21 inch greater than the normal for February. The greatest monthly total was 5.17 inches, at Mount Pocono, and the least 1.36 inches, at Erie. The greatest amount recorded in any 24 consecutive hours was 1.98 inches, at Pottstown on the 25-26th. Snowfall for the State averaged 11.7 inches, which is 1.3 inches above the monthly normal. The greatest total snowfall was 25.0 inches, at Carlisle, and the greatest 24-hour amount was 12.0 inches at West Chester on the 21st.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.  
CHARLES F. MARVIN, Chief.

# CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV. MARCH, 1929. No. 3

## GENERAL SUMMARY.

March was unusually mild, although no heat records were broken. Only one cold period, from the 8th to 10th inclusive, occurred during the month, the temperatures being almost constantly above the normal at other times. The maximum temperature of 89° has been exceeded only once during the last 42 years, although the State mean temperature has been exceeded four times in that period. The frost did not penetrate the soil deeply at any time, and there was very little in the ground after the middle of the month. The rainfall averaged about three-fourths of the March normal, while the snowfall was less than two-thirds of the normal at most places. Wheat fields had very little snow covering during the month, but the grain suffered very little damage in consequence as the frost did not heave the top soil. Building and construction work made unusually good progress for the season of the year, being favored by much fair weather with temperatures mostly above freezing. In Philadelphia it was possible to pour concrete most of the time with little danger of damage by freezing. Light to moderate general rains, supplemented by melting snows over the upper portions of the watershed, caused a sharp rise in many of the streams about the middle of the month, but no material damage was reported. The month was comparatively free from severe or damaging storms. High winds did some damage in a few places during the passage of a moderately intense storm on the 5th, 6th, and 7th, but the weather conditions as a whole were much milder and more agreeable than are common to the month of March.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 86 stations, was 43.7°, which is 6.2° in excess of the March normal. The highest monthly mean was 48.6°, at Hanover, and the lowest 35.4°, at Mount Pocono. Extremes for the month ranged from a maximum of 89°, at Vandergrift on the 25th, to a minimum of 5° below zero at Montrose on the 9th. The greatest daily range of temperature was 56°, at Hyndman on the 11th.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations taken at 130 well-distributed stations, was 2.69 inches, or 0.85 inch less than the normal for March. The greatest monthly total was 4.50 inches, at Warren, while the least, 1.37 inches, was recorded at Ebensburg. The greatest amount recorded in any 24 consecutive hours was 1.42 inches, at Uniontown on the 5th. The average snowfall for the month was 4.4 inches; a deficiency of 2.6 inches as compared with the March normal. The greatest total snowfall for the month was 22.0 inches, at Freeland, which station also reported the greatest 24-hour fall: 13.0 inches on the 2d.

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV. APRIL, 1929. No. 4

GENERAL SUMMARY.

A large temperature excess accumulated during the first ten days of the month, and the mean temperature was somewhat above the April normal although there was a slight to moderate deficiency most of the time after the 10th. Rains were frequent, there being an average of fifteen days with .01 inch or more precipitation. The average rainfall of 6.12 inches for the State exceeded all previous April records. Heavy local snows were reported from a number of stations in the mountain districts and in the northern tier of counties, but the snow did not remain long on the ground. Vegetation got an early and vigorous start during the warm period at the beginning of the month, but slowed up somewhat thereafter. The month was marked by an unusual number of severe local storms, some of which were apparently tornadoes. Damaging windstorms occurred in scattered locations in nearly all parts of the State on the 1st, but only one storm seems to have been a tornado. It started near Johnsbury and passed through Portland and then into New Jersey where its path ended near Blairsville. Three persons were killed in the storm path and the property damage exceeded \$50,000. Many persons reported having seen a funnel cloud in this storm. On the 16th, the date of heavy snows in many parts of the State, there was considerable damage by gales in Lehigh County. A rotary storm was reported in the city of York on the 25th. It did considerable damage in a path about 300 feet in width, and was undoubtedly a small tornado. The amount of the damage was not estimated. Farm work was delayed by the muddy condition of the soil, and was generally reported as backward at the close of the month. Crop growth was at about a normal stage. The planting of truck crops was especially slow. Wheat, rye, pastures, and meadows were reported in good to excellent condition and very promising.

TEMPERATURE.

The mean temperature for the month, as shown by reports of 87 stations, was 51.4°, which is 2.6°, warmer than the monthly normal. The highest monthly mean was 55.4°, at Holtwood and the lowest 44.4°, at Gouldsboro. The highest temperature recorded during the month was 94°, at Stroudsburg on the 4th, while the lowest, 19°, occurred at Gouldsboro on the 2d. The greatest daily range of temperature was 52°, at Ridgway on the 24th.

PRECIPITATION.

The average precipitation for the State for the month, as determined from observations taken at 135 stations, was 6.12 inches, which is 2.72 inches greater than the normal for April, and also the greatest ever recorded since State-wide records were begun in 1888. The greatest monthly total was 8.94 inches at Elk Lick and the least was 3.31 inches at Center Hall. The greatest amount recorded in any 24 consecutive hours was 3.80 inches, at New Park on the 15-16th. Snowfall for the State averaged 1.1 inches, which is 1.7 inches less than the normal for the month. The greatest monthly snowfall was 13.0 inches at Montrose, and the greatest 24-hour snowfall was 9.0 inches, at Towanda on the 15-16th.

# CLIMATOLOGICAL DATA.

## PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXIV. MAY, 1929. No. 5

### GENERAL SUMMARY.

A moderate temperature deficiency in May was due to severely cold periods that centered about the 10th and 20th respectively. At these times freezing temperatures were recorded in large portions of the State with much damage to orchard fruits, and nearly a complete loss in some localities. Light to moderate rains occurred at frequent intervals during the month, the heaviest rain-falls being generally on the 3d and 19th. Field work was delayed to a considerable extent by the muddy condition of the soil, and crops grew slowly by reason of the low soil temperatures. Wheat, rye, and grass lands made the best showing, the conditions being favorable for their growth. Wheat and rye grew a heavy straw, and were heading rapidly at the close of the month. They were generally reported as being considerably better than the average crops. Hay was more promising than the crop of last year which was called a bumper. Corn came up a fairly even stand in most places, but grew slowly. Truck crops were mostly backward, but otherwise in good condition. Severe windstorms and heavy local rains occurred at several places on the 2d and 3d. The chief damage by wind was reported from Uniontown and York, while the heaviest rainfall occurred at Muncy Valley. Damaging local storms were numerous on the 23th and 29th. A cloud burst flooded Belle Creek, in Susquehanna County, doing many thousands of dollars damage. Much damage was done to buildings in Harrisburg by lightning on the 28th, among them being a hospital and a church. Two persons were killed and five seriously injured by lightning at Johnstown. A church was badly damaged at Lansford. There seemed to be more than the usual amount of disagreeable weather during the month, and it was not wholly favorable for agriculture.

### TEMPERATURE.

The mean temperature for the State, as shown by reports from 87 stations, was 58.5°, which is 1.0° lower than the normal for May. The highest monthly mean was 63.0° at Philadelphia-Point Breeze, and the lowest 52.2° at Brookville. The highest temperature recorded during the month was 97° at Lock Haven on the 30th, while the lowest, 23°, was recorded on the 10th at three stations: Brookville, Ridgway and Somerset. The greatest daily range of temperature for the month was 56°, at Ridgway on the 1st.

### PRECIPITATION.

The average precipitation for the State, based on reports from 134 well-distributed stations, was 4.81 inches, or an excess of 0.82 inch over the normal. The greatest monthly total was 8.43 inches at Clearfield, while the least, 1.96 inches, was reported from the Philadelphia Navy Yard station. The greatest amount reported in any 24 consecutive hours was 3.65 inches at Muncy Valley on the 3d. Light snow fell at several stations during the early part of the month, with the greatest monthly total 1.0 inch at Bradford, all of which occurred on the 4th. The State average, however, was but a trace.

### SUNSHINE, HUMIDITY AND WINDS

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV.

JUNE, 1929.

No. 6

## GENERAL SUMMARY.

June began with temperatures considerably below the normal and frost occurred at many places on the morning of the 3d. There was little rain until the 3th when moderate showers were fairly general. During the second decade the temperatures rose steadily, reaching a maximum at most places on the 18th or 19th when the heat broke up with severe thunderstorms in nearly all parts of the State. Many buildings were fired by lightning, and four deaths by lightning were reported. Considerable damage was done in these storms by wind and hail. The last decade was marked by more than the usual number of severe local storms. On the 24th a cloudburst in Indiana County did about \$40,000 damage over an area one-and-one-half by six miles. On the 28th wind and heavy rains in Kane and vicinity did damage that was estimated at upwards of \$150,000, with no evidence of tornadic action. On the same date a tornado in southeastern Fayette County passed through a sparsely settled region wrecking two houses and a store building with damage estimated at \$25,000. It also wrecked many trees and did some damage to crops. Storms of lesser intensity were reported from many places in the State on these dates. The rainfall was far below the normal up to the 20th, after which frequent heavy showers nearly made up the deficiency. Crop growth was slow during the first decade on account of low temperatures, but speeded up somewhat during the second decade despite the shortage in moisture. At the close of the month most crops were seasonably advanced. Wheat had ripened very rapidly, and was practically ready for harvest which usually begins from July 7th to 10th. The crop appeared to be better than the average, the straw being heavy and the heads large.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 86 stations, was 67.8°, which is 0.4° colder than the July normal. The highest mean, 73.5°, was recorded at Philadelphia-Germantown, and the lowest, 60.2°, was reported from Ridgway. The highest temperature for the month was 98°, recorded at Clearfield and Lock Haven on the 19th, at Phoenixville on the 19th and 20th, and at George School on the 21st. The lowest for the month was 28°, at Ridgway on the 3d. The greatest daily range of temperature was 52°, at Mauch Chunk on the 11th.

## PRECIPITATION.

The average precipitation for the State as shown from reports of 134 stations, was 3.56 inches, which is a deficiency of 0.54 inch as compared with the June normal. The greatest monthly amount was 6.77 inches at Pine Grove, while the least was 1.10 inches at Lloyd. The greatest amount recorded in any 24 consecutive hours was 3.35 inches at Cloe on the 23d.

PHILADELPHIA, PA.

Vol. XXXIV. JULY, 1929. No. 7

## GENERAL SUMMARY.

The temperatures for July averaged near the normal with no unusual extremes. The rainfall averaged less than two-thirds of the normal and was very unevenly distributed. In general the rains were heaviest in the northwestern quarter of the State, but were light near Lake Erie. At the end of the month a drought had developed in many places sufficient to nearly stop the growth of crops, while pastures were beginning to turn brown. Wheat harvest was nearly finished during the month, and considerable threshing was done. Yields were fair to good but in many instances they were less than was expected as the heavy straw and large heads of grain had indicated better than an average crop. Oats harvest was in full swing at the end of the month with considerably less than a normal crop in prospect. Early corn was bearing, and was generally fair to good, while late fields were being seriously stunted by the drought. Truck crops of all kinds were needing rain. The month was marked by about the usual number of damaging local storms with no very heavy losses in any part of the State. Minor damage by lightning was reported from nearly all parts of the State, some stock being killed and several barns being struck and burned, but only one human life was lost as far as known. Harry Sims, a farmer in Washington County was killed on the 24th. The greatest property damage was in Lancaster County where a loss estimated at \$28,000 was sustained on two farms. The greatest damage by wind occurred as an accompaniment of heavy thunderstorms in Wayne County on the 24th, many orchards being seriously damaged and many trees torn up by the roots. Telegraph and telephone wires were torn down, and minor damage was done to buildings.

## TEMPERATURE.

The mean temperature of the State as shown by reports from 86 stations, was 71.8°, which is 0.1° lower than the July normal. The highest monthly mean was 77.2° at Holtwood, and the lowest was 64.8° at Ridgway. The highest temperature recorded during the month was 99°, at Carlisle and Hyndman on the 28th, while the lowest was 33° at Brookville on the 20th. The greatest daily range of temperature was 51° at Muncy Valley on the 20th.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations taken at 132 well-distributed stations, was 2.81 inches, which is 1.54 inches less than the normal for the month. The greatest monthly amount was 6.97 inches at Franklin, and the least, 0.19 inch, fell at Stroudsburg. The greatest amount recorded in any 24 consecutive hours was 3.14 inches, at Creek-side on the 24-25th.

# CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV. AUGUST, 1929. No. 8

## GENERAL SUMMARY.

The temperatures during August were slightly below the normal about two-thirds of the time with no marked departures. The rainfall was about three-fifths of the August normal, and greatly intensified the drought conditions that began at the end of the first decade in July. The growth of all vegetation, excepting trees, was stunted, and crops ripened prematurely. Early corn fields were mostly fair to good, but late fields did not ear properly and many were worthless except for ensilage. Early potatoes were dug during the month and were mostly good in yield and quality. The late crop did not make good settings, and the vines dried before the tubers could attain proper sizes. Grasses nearly stopped growing, and many pastures dried out and turned brown. Little plowing for wheat could be done during the latter part of the month as the soil was too dry and hard. Small streams and ponds dried up and the larger streams became very low. Despite the shortage in rainfall, the severity of the local storms seemed to be greater than usual, and the damage in some regions was heavy. On the 13th a hailstorm in Adams county did much damage to corn and orchard fruits. On the 14th severe storms were reported from many places. On that date four persons were killed by lightning in the Philadelphia district and considerable minor property damage was done. Boyerton, in eastern Berks county experienced three severe thunderstorms within 24 hours with a property damage estimated at upwards of \$100,000. Lightning burned three barns in Lebanon county with losses estimated at \$13,500. On the 19th a hailstorm in northern Bucks county damaged crops to the extent of \$10,000 or more. On the 27th lightning and hail did damage in Lebanon county estimated at upwards of \$200,000.

## TEMPERATURE.

The mean temperature for the State, as deduced from reports of 86 stations, was 67.7°, which is 2.3° below the normal August temperature. The highest monthly mean was 75.2° at Holtwood and the lowest was 60.7° at Gouldsboro. The highest temperature recorded during the month was 98°, at Arendtsville and Carlisle on the 1st, and the lowest was 31°, at Gouldsboro on the 20th. The greatest daily range of temperature was 52°, at Clearfield on the 21st.

## PRECIPITATION.

The average precipitation for the State, as shown by observations taken at 134 stations, was 2.52 inches: a deficiency of 1.71 inches as compared with the monthly normal. The greatest monthly amount was 7.20 inches, at Phoenixville, while the lowest was 0.20 inch at Lloyd. The greatest amount recorded in any 24 consecutive hours was 4.24 inches at Lansford on the 14th.

## SUNSHINE, HUMIDITY AND WINDS

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.  
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV.

SEPTEMBER, 1929.

No. 9

GENERAL SUMMARY.

September temperatures averaged above the normal in nearly all parts of the State as a result of excessive heat during the first week. A new September maximum was established by a temperature of 101° at Lewisburg on the 3d. Before the beginning of the State Weather Service in 1888, a maximum of 102° was recorded at Philadelphia. This was on September 7, 1881. Frosts and freezing temperatures covered the greater portion of the State from the 19th to the 21st inclusive, doing some damage to late corn and killing garden vegetation in some sections. No unusual losses were sustained as such frosts after the middle of the month are normal in the northern counties and in a large portion of the mountain region. The drought that gradually developed during July and August was broken in the eastern portion of the State at the beginning of the second week, but continued in western counties until the middle of the month. Silo filling and the digging of the early potato crop progressed up to the end of the third week, after which the seeding of winter wheat became the chief occupation. The soil was generally in good condition for seeding and the work was well advanced at the end of the month. The drought stunted the late potato crop very badly and many of the vines dried up with only small tubers developed. Pastures improved rapidly after the breaking of the drought, and were mostly in good condition at the close of the month. Severe local storms accompanied the breaking of the drought in some sections, and damage resulted from lightning and high winds with some damage by the sudden flooding of small streams. The larger streams were not raised to flood stages. Lightning damage, chiefly from the burning of barns, probably exceeded \$100,000.

TEMPERATURE.

The mean temperature for the State, as shown by reports from 37 stations, was 65.7°, an excess of 1.7° as compared with the September normal. The highest monthly mean was 71.5° at Holtwood, and the lowest, 59.1° at Brookville. Extremes for the month ranged from a maximum of 101°, at Lewisburg on the 3d, to a minimum of 24°, at Brookville and Kylertown on the 19th. The greatest daily range of temperature was 51°, at Franklin on the 1st.

PRECIPITATION.

The average precipitation for the State, as determined by reports from 135 well-distributed stations, was 3.71 inches, which is 0.23 inch greater than the monthly normal. The greatest monthly amount was 8.72 inches, at Zelienople, while the lowest, 1.05 inches was reported from Pittsburgh. The greatest amount recorded in any 24 consecutive hours was 5.08 inches, at Hollisterville on the 7-8th.

SUNSHINE, HUMIDITY AND WINDS

CHARLES F. MARVIN, Chief.

# CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV. OCTOBER, 1929. No. 10

## GENERAL SUMMARY.

Moderate temperature changes were frequent during the month with no unusual extremes. A large excess in rainfall was due to heavy general rains at the beginning of the month, and again on the 21st and 22d. There was much fair and fine weather during the remainder of the month, and outdoor work made good progress. Each period of heavy rains flooded many small streams and some of the larger ones. The first rains flooded streams in the western part of the State, including the Monongahela, bringing a flood stage to Pittsburgh and doing damage to the extent of about \$10,000. The second period of rains seemed to be the heaviest in the central part of the State, flooding the Juniata and its tributaries and doing considerable damage in Mifflin County. This period of rains was accompanied by severe local windstorms. At the Shamokin airport a damage of \$15,000 was reported. The path of destruction was narrow, but no funnel cloud was observed. Williamsport and Newberry suffered heavy damage to wire service of all kinds, and many large trees were uprooted. Lesser damage was reported from many places in the central and eastern portions of the State. The crop season practically ended with October, although corn husking was only about half done at the close of the month. Reports revealed the fact that the yields of each and every crop were below the average excepting potatoes. The better showing of that crop was due to early varieties which did not suffer much from the summer drought. Late varieties yielded below the average. The hay crop was nearly up to the normal due to heavy first cuttings. The yields of orchard fruits were far below the average, the apple crop being the lightest for many years.

## TEMPERATURE.

The mean temperature for the State, as determined from observations taken at 88 stations, was 50.6°, which is 1.8° lower than the normal for the month. The highest monthly mean was 56.2°, at Philadelphia-Point Breeze, and the lowest 44.6°, at Gouldsboro. The highest recorded during the month was 55°, at Beaver Dam on the 19th, while the lowest, 14°, occurred at Gouldsboro on the 11th. The greatest daily range of temperature was 52°, at Clearfield on the 19th.

## PRECIPITATION.

The average precipitation for the State, as shown by reports from 136 well-distributed stations, was 5.59 inches: an excess of 2.41 inches over the October normal. The greatest monthly total was 10.40 inches at Weikert, and the least was 1.65 inches at Erie. The greatest amount reported as falling in any 24 consecutive hours was 4.70 inches at Weikert on the 2d. Snowfall for the month averaged a "trace" as compared with an October normal of 0.1 inch. But one station reported a measurable fall, 0.2 inch falling at Morris Run on the 17th.

## SUNSHINE, HUMIDITY AND WINDS

# CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV. NOVEMBER, 1929. No. 11

## GENERAL SUMMARY.

November temperatures were mostly above the normal up to the 20th, after which there were two cold periods. The last cold period assumed the proportions of a cold wave, and established a new November minimum for the State and for a large number of stations. A temperature 10° below zero was recorded at Elk Lick on the 30th. Heavy snow fell at several stations in the western portion of the State with a maximum of 13.8 inches at Erie, while Elk Lick, in Somerset County, reported 12.0 inches. The average precipitation for the State was above the November normal, due quite largely to heavy rains in the western part from the 16th to the 18th inclusive. These rains raised the Monongahela and Youghiogheny rivers nearly to flood stages, and there was a near flood stage in the Ohio river at Pittsburgh. In the remainder of the State heavy rains were reported locally, but not generally. Winter grains continued to grow during the first three weeks, and became well rooted and in good condition for the coming winter. Pastures were fair to good during the fore part of the month, especially in the southeastern counties. The month as a whole was favorable for outdoor work and building operations proceeded with few interruptions. Field work made good progress. Corn husking was nearly finished and a large portion of the fodder was hauled in at the close of the month. Potato digging was finished during the first week. The month was comparatively free from severe or damaging local storms, and no special reports of damage by either wind or rains were received.

## TEMPERATURE.

The mean temperature for the State, as determined from reports of 88 stations, was 41.1°, which is 0.1° above the normal for the month. The highest monthly mean was 47.8°, at Philadelphia-Point Breeze, and the lowest 35.5° at Brookville. The highest temperature recorded during the month was 81°, at Uniontown on the 1st and at Holtwood and Narberth on the 2d. The lowest was -10°, at Elk Lick on the 30th. The greatest daily range of temperature was 40°, at Brookville on the 12th and at Corry on the 23d.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations taken at 134 stations, was 3.39 inches; an excess of 0.58 inch as compared with the November normal. The greatest monthly total was 5.07 inches at Pennline, while the least, 1.89 inches, fell at Weikert. The greatest amount recorded in any 24 consecutive hours was 2.33 inches, at Mount Pocono on the 17-18th. Snowfall for the month averaged 1.9 inches, which is 1.2 inches more than the normal for November. The greatest monthly snowfall was 13.8 inches at Erie, where 9.5 inches fell during the storm of the 21st.

# CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXIV. DECEMBER, 1929. No. 12

## GENERAL SUMMARY.

December began with intense cold under the influence of a moderate cold wave that spread over the Middle Atlantic states on the last day of November. This temperature deficiency was offset by an excess during the third week, when high temperature records for December were broken in some places, and the mean for the month was slightly above the December normal. During the mild temperatures of the third week thunderstorms occurred at many places, and were moderately severe in some places. An outstanding feature of the month's weather was the extremely large amount of cloudiness, especially in the western part of the State. Erie recorded only three percent of the possible sunshine, and Pittsburgh nineteen percent. The mean precipitation for the State was somewhat below the normal, but the snowfall was near the normal excepting a small area in the southeast where the proportion of rain was a little larger. Glaze storms occurred in the southeastern part of State on the 2d and 23d, coating the highways with ice, making travel extremely difficult, and causing hundreds of accidents. In the remainder of the State these storms caused moderately heavy snows. The conditions were mostly favorable for winter grains. During the cold wave on the 1st the ground froze to a depth of from three to ten inches, and was almost immediately blanketed with snow. The snow generally melted within a week, and the frost disappeared before the middle of the month. When the second blanket of snow came on the 23d the ground was mostly free from frost. The winter grains were reported to be in good condition at the close of the month. There were no severe or destructive storms.

## TEMPERATURE.

The mean temperature for the State, as shown by reports from 88 stations, was 32.2°; or 1.1° above the December normal. The highest monthly mean was 38.2°, at Philadelphia Weather Bureau, and the lowest 27.6°, at Gouldsboro and Montrose. The highest recorded during the month was 70°, at Hanover on the 14th, and the lowest was -9°, at Brookville on the 1st. The greatest daily range of temperature was 44°, at Brookville on the 13th.

## PRECIPITATION.

The average precipitation, from rain, sleet and melted snow, for the State, computed from reports of 133 well-distributed stations, was 2.77 inches, which is 0.46 inch less than the normal for the month. The greatest monthly amount was 4.95 inches at Clearfield, and the least 1.21 inches at Newell. The greatest amount recorded in any 24 consecutive hours was 1.60 inches at Shawmont on the 18th.

Snowfall averaged 10.0 inches, compared with a December normal of 9.2. The greatest total snowfall for the month was 18.5 inches at Elk Lick, while the greatest 24-hour fall, 9.5 inches, occurred at Emporium on the 23d.

VOL. XXXIV. ANNUAL SUMMARY, 1929. No. 13.

## GENERAL SUMMARY.

The year as a whole developed a moderate excess in temperature, due chiefly to the mild conditions that prevailed in March and April. January was a seasonable month with somewhat less than the normal snowfall. The grain fields were bare a large part of the month and the frost penetrated deeply. February was also a seasonable month with a moderate excess in snowfall. However, the snow melted rapidly after each storm, and the fields were bare the greater portion of the month. Ice jams caused floods in the Allegheny river from Kittanning to Pittsburgh with only slight damage reported. Near flood stages occurred in all of the river districts. March accumulated a large excess in temperature, while its rainfall and snowfall were deficient. Grain fields had little snow covering but at the close of the month the conditions were reported as generally good, and it seemed that the losses from winter killing had been no greater than usual. Mild conditions continued from March through the first half of April and vegetation got an early and vigorous start, after which there was some slowing up before the end of the month. April was marked by severe wind storms. In Northampton county a tornado occurred on the 1st, killing three persons and doing considerable property damage. The mild temperature conditions broke sharply on the 16th when heavy snows occurred over a large portion of the State accompanied by high winds and gales that did considerable damage. On the 25th a small tornado occurred in the city of York with considerable damage along its path, but with no deaths reported. May was a generally seasonable month and favorable for crop growth, but was marked by an unusual number of damaging local storms. June temperatures showed unusual extremes, and the month was unfavorable in many respects. Frost occurred at many places on the 3d, after which the temperature rose steadily to a point considerably above the normal, and broke up in severe thunderstorms on the 18th and 19th with heavy and widespread damage by lightning and winds. Winter grains developed a heavy straw and ripened rapidly with harvest beginning at the close of the month, from a week to ten days earlier than usual. Following a moderate shortage of rainfall for June there was a much larger shortage during July and August with an accumulated deficiency of nearly four inches for the three months. The drought was severe enough to stunt the growth of all crops, and developed the most unfavorable crop season that Pennsylvania has experienced for many years. Threshing revealed the fact that the winter grains did not fill well despite the heavy straw that seemed to presage heavy yields. The oats crop was light and corn was badly stunted. The first cutting of hay was heavy and unusually good, but latter cuttings were invariably light. Likewise early potatoes returned good yields of fine quality, while the late crop was almost a complete failure in some sections. Good rains occurred after the middle of September and continued through October, replenishing the water supply and restoring the pastures to an excellent condition. They improved late truck in some places, but were too late to benefit other crops. November was generally favorable with a severe cold wave at the close of the month. December was seasonable excepting the third week which was excessively warm and high temperature records were broken at several places.

## COMPARATIVE ANNUAL DATA FOR THE STATE

| Year      | Temperature |        | Precipitation  |             | Year      | Temperature |        | Precipitation  |             |

## CLIMATOLOGICAL DATA.

PENNSYLVANIA SECTION.  
GEORGE S. BLISS, Meteorologist.  
PHILADELPHIA, PA.

VOL. XXXV. JANUARY, 1930. No. 1

## GENERAL SUMMARY.

The first half of the month was mild, the temperatures being almost constantly above the normal with an excess reaching as much as 20° to 25° at times. A sharp drop occurred on the 16th and thereafter the temperatures were almost constantly below the normal. A little more than half of the precipitation occurred as rain during the first half of the month. The snowfall distribution was rather unique. Instead of the heaviest snows being recorded in Somerset, and some of the northwestern counties where they usually occur, the greatest amounts were reported from Lancaster, Lebanon, York, and Adams counties, where they ranged from seventeen inches. A single exception was the station of Corry, in the eastern edge of Erie county, which reported a total snowfall of twenty inches. The heaviest snowfall occurred on the 18th and 19th, and blocked the highways for 24 to 36 hours before they could be cleared. However, the snow did not cause as much delay and not nearly so many accidents as occurred on the 13th when rain froze and formed a thin film of glare ice on all paved roads in the eastern portion of the State. The fields were snow-covered during the coldest periods, and the frost did not penetrate the soil deeply as a rule. In consequence the winter grains were reported to be in generally good condition at the end of the month. Outdoor work of all kinds made fair to good progress during the first half of the month, but most building operations were slowed up during the last half by the snow and the intense cold. During the first three weeks there was more cloudiness than usual, and much fog occurred during the first half of the month. There were no gales or destructive storm conditions during the month.

## TEMPERATURE.

The mean temperature of the State, as shown by reports from 86 stations, was 29.2°, which is 1.4° above the January normal. The highest monthly mean was 35.6°, at Philadelphia-Weather Bureau and the lowest 23.9°, at Gouldsboro. The highest temperature recorded during the month was 72°, at Hanover on the 9th, while the lowest -24°, occurred at Lancaster on the 19th. The greatest daily range of temperature was 48°, at Gouldsboro on the 10th.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations taken at 133 well-distributed stations, was 2.25 inches; a deficiency of 1.08 inches as compared with the normal. Monthly totals ranged from a maximum of 4.74 inches at Emporium to a minimum of 0.70 inch at Hyndman. The greatest amount recorded in any 24 consecutive hours was 1.50 inches at Brookville on the 12th. Snowfall averaged 8.4 inches, compared with a January normal of 11.0 inches. The greatest monthly amount was 20.2 inches at Corry. The greatest 24-hour snowfall was 11.0 inches at York on the 18th.

## SUNSHINE, HUMIDITY AND WINDS

VOL. XXXV.

FEBRUARY, 1930.

No. 2

## GENERAL SUMMARY.

February was unusually mild, especially the last ten days, during which time all previous February records for high temperatures were broken at many stations. The maximum for the State, 80 degrees at Quakertown, has been exceeded only once during the 42 years of the State Weather Service. The precipitation averaged nearly normal, but occurred mostly as rain. The snowfall was a little more than a third of the February normal. Moderately heavy snows occurred locally at a few stations, but the snow melted rapidly and soon disappeared. The ice harvest in the Pocono mountains was suspended when about two-thirds of the usual supply had been housed. Fields were bare of snow cover most of the time, but the frost did not penetrate the soil deeply, and the winter grains suffered but little if any damage, and were generally reported to be in good to excellent condition at the close of the month. During the excessive temperatures the grain started to grow, and the fields became quite green. Buds swelled on orchard trees in sheltered places, and some damage resulted. The month was favorable for outdoor work, and plowing was reported from a few places. The ice began to break in the streams of the Ohio watershed on the 23d, and thunderstorms with moderately heavy rainfall intensified the condition on the 24th, resulting in ice jams at several places. No damaging floods occurred in the larger streams, although near flood conditions were reached at several stations. Many creeks and small streams were flooded, and caused some damage. Cloudiness was excessive excepting a few southeastern counties where the sunshine was near the normal. The month was free from damaging storms excepting local thunderstorm winds which attained gale force in a few places.

## TEMPERATURE.

The mean temperature of the State, as shown by reports from 89 stations, was 35.1°, which is 7.4° in excess of the February normal. The highest monthly mean was 41.0°, at Uniontown, and the lowest 26.6° at Mount Pocono. The highest temperature recorded during the month was 80°, at Quakertown on the 25th, while the lowest, -18°, was registered at Brookville on the 16th. The greatest daily range of temperature was 50°, at Lancaster on the 20th.

## PRECIPITATION.

The average precipitation for the State, as deduced from observations made at 134 stations, was 2.69 inches, which exceeds the February normal by 0.03 inch. The greatest monthly total was 4.88 inches at Cresson, and the least 0.93 inch at Lloyd. The greatest amount recorded in any 24 consecutive hours was 2.73 inches at Coraopolis on the 24-25th. Snowfall averaged 3.9 inches, which is 6.5 inches less than the normal for the month. The greatest monthly total was 15.5 inches at Cresson, which station also reports the greatest 24-hour fall: 7.0 inches on the 4th.

## SUNSHINE, HUMIDITY AND WINDS

## PENNSYLVANIA SECTION.

GEORGE S. BLISS, Meteorologist.

PHILADELPHIA, PA.

VOL. XXXV.

MARCH, 1930.

No. 3

### GENERAL SUMMARY.

March was more pleasant and agreeable than usual, and especially so in the southeastern counties. The temperature averaged near the normal in the western half of the State, while there was a moderate excess in the eastern section. Likewise the snowfall averaged near the normal in the north-central counties, while south of the Blue Ridge mountains there was very little snow. The heaviest snows were in the northwest, in Crawford, Warren, and McKean counties where the average was about 20.0 inches. There was less windy and blustery weather than is usually experienced in March. Although there was no snow cover on the fields of the chief wheat growing regions, the grain did not seem to be harmed. There was very little freezing and heaving of the top soil, and at the end of the month the condition of the winter grains was reported to be fully up to the ten-year average. The usual March floods did not materialize this year. There were some near flood stages in the Ohio drainage basin, but scarcely any high water in the Susquehanna or Delaware systems. In the southeastern counties the weather conditions were favorable for outdoor work a large portion of the time. Building operations made fair progress, and farmers did some plowing. Dormant spraying of orchards was done during the latter part of the month, and the trees were generally reported as having wintered in good condition. An unseasonably warm period in February was reported as having done damage to orchards in some places, but later it seemed to have been a false alarm. The highways were in good condition in the eastern counties excepting a 24-hour period when they were covered by a thin coating of ice. In the western portion of the State they were temporarily closed by snow on the 1st and 2d, and again on the 25th and 26th.

### TEMPERATURE.

The mean temperature of the State, as shown by reports from 89 stations, was 37.9°; an excess of 0.4° over the March normal. Monthly mean temperatures ranged from 44.0° at Hanover to 29.1° at Mount Pocono. The highest temperature recorded during the month was 78°, at Phoenixville on the 17th, and the lowest -9°, at Brookville on the 3d. The greatest daily range of temperature was 51°, at Hyndman on the 16th and also at Lancaster on the 17th.

### PRECIPITATION.

The average precipitation for the State, as determined from observations made at 133 well distributed stations, was 3.03 inches; or a deficiency of 0.51 inch compared with the normal for March. The greatest monthly amount was 5.05 inches at Arendtsville, while the lowest, 1.04 inches, was recorded at Mount Pocono. The greatest amount recorded in any 24 consecutive hours was 2.90 inches on the 7-8th at Arendtsville. Snowfall averaged 4.9 inches, which is 2.1 inches less than normal. The greatest monthly snowfall was 24.2 inches at Warren. The greatest 24-hour snowfall, 8.0 inches, fell at Corry on the 2-3d.
